

Narrative Intelligence

Volume IV of The Anteriority Corpus

Introduction

Every system that survives learns how to read. States read populations, markets read value, security systems read inputs, and AI reads tokens.

Chapter 1 – The First Reading Machine

Recognition requires legibility. Institutions ask subjects to become readable before they can be recognized.

Chapter 2 – Orientation Systems

Security boundaries are orientation systems that organize possibility before they classify behavior.

Chapter 3 – The Economy of Legibility

Recognition is never free. Institutions exchange recognition for readability.

Chapter 4 – Gravity

Classification compresses possibility into administrable categories.

Chapter 5 – Levity

Every sorting machine leaves a remainder: structured excess that exceeds available categories.

Chapter 6 – The Detector

Detectors inherit categories and participate in producing the populations they measure.

Chapter 7 – The Third Term

Reading requires a frame. Architecture constitutes the relationship between reader and text.

Chapter 8 – Architecture Is Prior to Governance

Governance manages possibilities; architecture creates them.

Chapter 9 – Narrative Intelligence

Narrative Intelligence studies how categories emerge, stabilize, and organize reality.

Chapter 10 – The Open Question

Is the surplus real, or only not-yet-incorporated? The framework leaves the question open.
