

THE ANTERIORITY CORPUS · VOLUME IV

*Every system that survives learns how to read —
and every reading leaves a remainder it cannot see*

States read populations; clinics read diagnoses; markets read value; security systems read inputs; large language models read tokens. Narrative Intelligence argues that beneath all of them runs a single operation — the conversion of open possibility into an administrable category — and that every such concentration leaves a structured surplus the system cannot digest.

From that claim follows a thesis with teeth for anyone building intelligent systems: architecture is prior to governance. A system's ethical and security properties are fixed by its constituting topology before any policy or classifier acts. The constructive program is a discipline of negation — and the book's final turn is to ask, honestly, what negation leaves out.

A work of theory that moves from queer phenomenology through computer security to the design of machines, holding the exact and the speculative strictly apart, and ending on the question it cannot answer: who am I?

THEORY · SECURITY ARCHITECTURE · PHILOSOPHY OF
COMPUTATION
